raios360

# Run your field teams from one system.

One platform for more reliable inspections, audits, field work, compliance, maintenance, and AI-powered reporting.

Raios360 gives operations teams real-time visibility into every task, visit, inspection and field report — even when your team is offline.

## Capture it. Verify it. Act on it.

**Works offline · GPS verification · AI-powered reporting · Built for mobile teams**

## Six places your field data lives today. Then one.

BEFORE RAIOS360

- Updates arriving as WhatsApp messages
- Paper forms that reach the office days later, if at all
- Excel spreadsheets, re-keyed by hand and version-forked
- Visits nobody can prove actually happened
- Photos scattered across a dozen personal phones
- Hours spent compiling a report that is stale on arrival

WITH RAIOS360

### One operational record.

Every visit carries its own assignment, location, answers, photos and verification — in one record, from the moment it is scheduled to the moment someone acts on it. Nothing is re-keyed. Nothing is chased.

**Assignment** — **GPS** — **Form** — **Photos** —
**Verification** — **AI** — **Report** — **Action**

## From assignment to verified result

STEP 1

### Assign

Give every team member clear work, locations and deadlines.

STEP 2

### Execute

Capture photos, signatures, GPS and data — even without connectivity.

STEP 3

### Verify

Automatically check submissions, locations, attendance and anomalies.

STEP 4

### Act

AI summarizes what happened and tells managers what needs attention.

## Build the field app your operation needs — without code.

Your own admins build the workflows, pages and metrics your team runs on — in the browser, from ready-made blocks, on the same records your field team already creates. No developer, no software project, no waiting for a release.

WORKFLOWS

### When something happens, the next step happens by itself.

29 triggers · 24 actions · 14 ready-made templates

- Start on an event, on a schedule, or on demand from a button
- Notify, assign a task, ask for approval, update a record, create a ticket or a visit
- Branch, wait, repeat for each line item, or run two lanes at once
- Escalate to Manager follows the reporting line, never a broadcast
- Test against real submissions before it goes live

PAGES

### The exact screen your team needs, from blocks.

24 block types for record pages and dashboards

- A record page puts a client's, a visit's or a task's fields, history and next actions in one place
- Dashboards of KPIs, charts, rosters and tables
- Buttons that fill a form, change a status or run a workflow
- Publish to the mobile app, and the field team sees the same page, even offline

METRICS

### Define a KPI once. Use it everywhere.

7 metric types over 11 kinds of record

- Count, sum, average, percentage, ratio, trend and comparison
- The same number on the dashboard, the record page and the report
- Start from recommended metrics, imported as drafts
- A metric that turns Warning or Critical can start a workflow — once per crossing

Start from a template — location, validation, approvals, notifications, automation, escalations and scheduled — added in one click and edited like anything you built.

Built on Raios360's own records — tasks, visits, forms, clients, products, leads and your own databases. It is not a general-purpose app builder. A workflow reaches software outside Raios360 only through a webhook you configure; Post to Chat Channel posts into a Raios360 messaging channel, not an outside chat app. A workflow does what you set it up to do, and only while it is switched on.

## Why operations teams choose Raios360

WORKS ANYWHERE

### Offline-first field operation.

Forms, photos, GPS and signatures capture with no signal and sync themselves when it returns. Built for spotty data and low-end Android.

AI BUILT IN

### Turn field data into decisions.

Drafts the report, flags the anomaly on a schedule, and answers plain-language questions about your own data — bounded by each user's permissions.

ENTERPRISE-READY

### Organization-isolated data and granular permissions.

Strict tenant isolation enforced at six independent layers, custom roles, a full audit trail, and recovery you can defend to a board or an auditor.

DEPLOY QUICKLY

### No custom software project required.

Start on your industry's templates, build the workflows, pages and metrics you need without code, and import clients and products from CSV. The trial is self-service and full-featured.

## Don’t just collect field data. Understand it.

### AI Report Assistant

**“Summarize today’s 147 inspections.”**

— 132 passed. 15 require follow-up.

— The most common issue was missing expiry dates on chilled stock — 9 of the 15.

— Two branches account for half of all failures.

Runs on any saved report: Executive Summary, Top & Bottom Performers, Anomaly Detection or Trend Narrative.

### Anomaly Detection

**“What went wrong today?”**

— 3 planned visits were missed — past the grace window with no check-in.

— 1 phone has sent no location for 94 minutes while clocked in.

— 2 shifts have run past 12 hours without a clock-out.

A scheduled scan, not a question you have to remember to ask. Thresholds are yours; findings can email the manager.

### Ask Your Data

**“Which region has the highest failure rate this month?”**

— Central Luzon — 8.7%, 2.1× higher than the company average.

— Driven by two distributors that started in March.

Answered with the chart or table, not just a sentence. Or ask from Claude, an IDE or your own app over MCP.

Example exchanges, with illustrative figures. Real answers come from your own data — and every one is bounded by the asking user’s permissions, so the assistant can never surface a record that person could not already open. Use the platform’s AI or bring your own key.

## No signal? No problem.

Your field team keeps working. Raios360 stores submissions, photos, GPS and signatures on the device and automatically synchronizes when connectivity returns. Built for spotty data, dead zones and low-end Android handsets — because that is where the work actually happens.

Online — **Offline** — Work — Sync — Cloud

### The reference photos come with you

Images attached to a form are downloaded during sync and cached on the device, so a worker can compare against the standard in a stockroom with no bars.

### You can see what hasn’t synced

An openable sync queue, with retry or discard per operation, and failed items shown apart from pending ones — so the badge never quietly under-reports.

### It never gets stuck offline

Connectivity is re-checked every ten seconds and again whenever the app is reopened, so a stale offline state can’t lock someone out of syncing.

## Know the work was really done, where it was meant to be.

Every submission arrives with the evidence attached, captured at the moment it happened rather than typed up later.

**GPS on arrival**
Check-in is location-stamped, with geofencing enforced at the visit, the form and any unplanned visit.

**QR and barcode scans**
Checkpoints, assets and products scanned in place rather than typed from memory.

**Photo and signature**
Captured in the form, at the moment, and carried with the submission rather than sitting on a phone.

**Anomalies, on a schedule**
Missed visits, a device gone quiet while clocked in, and over-long shifts are flagged without anyone asking.

Raios360 does not do facial recognition or biometric identity matching. A photo is evidence a person and a place were there together. Identity capture reads a document; it does not verify that the bearer is the person named.

## Ready-made for a specific job

A Solution installs the forms, pages and starter workflows for one job, already wired together. Its starter workflows arrive switched off — an admin turns on the ones they want.

**ID Document Capture**
Photograph the ID. The record fills itself in.

**On-Shelf Availability**
Know which must-carry products are on the shelf, store by store.

**Personnel Monitoring**
A work order opens the gate. A badge alone does not.

**Visitor Management**
Every visitor signed in, compared, and approved by a person.

**Leads**
From first contact to client, without retyping a thing.

**Paper Form Capture**
Keep the paper. Lose the re-keying.

**Public Feedback Survey**
A QR code at the counter, and every answer in a dashboard.

Built for Security Teams, Field Services, FMCG & Retail and Healthcare — and also serving Construction, Logistics, Agriculture, Utilities, Real Estate and Local Government.

Solutions are switched on per organization by our team rather than self-installed, and some carry a fee of their own. None does face matching or biometrics; where a Solution compares or checks, it advises a person, who decides.

## What it costs, and what stands behind it

Live on Google Play in 177 countries, running on Google Cloud infrastructure. No credit card, no setup fee, cancel anytime.

| 16 | 30 days | $18 | $180 |
|---|---|---|---|
| industry packages | free trial, self-service | per seat / month (USD) | per seat / year (USD) |

Enterprise: volume pricing and dedicated cloud infrastructure (single-tenant, with the option of customer-managed encryption keys). Priced for your volume and setup — contact us.

Raios360 does not hold its own SOC 2 or ISO 27001 certification; the Google Cloud infrastructure underneath is certified. Authorised staff can reach customer data to provide support, and every such access is audited.

## What it adds up to

**Give every manager exactly the visibility they need.**
162 configurable permission combinations

**Capture whatever the job actually requires.**
50 field types, including GPS, photo, signature and barcode

**Switch on only the parts your team uses.**
18 admin-toggled modules

**Ask your own data a question in plain English.**
26 AI tools, bounded by the asking user's permissions

### Keeps your teams close, to the people you serve

How much is field reporting costing you? We will not tell you what share of that we remove — we have not measured your operation. The trial is long enough for you to.
